Theory of Computation - Regular Grammars - Sanfoundry

Conversion of Regular Grammar into Finite Automata Given a regular grammar G , a finite automata accepting $L(G)$ can be obtained as follows: The number of states in the automata will be equal to the number of non-terminals plus one. Each state in automata represents each non-terminal in the regular grammar. The additional state will be the final

Proof Two Grammars Generate the Same Language ...

If this is a specific question, for two explicitly given grammars, we wait for your answer. If it is an "abstract" question, how do I prove that two right-linear grammars generate the same language, you probably want to transfer them into finite automata (which is easy).
